Wagner control pro 250m cleaning

Image not available forColour: Lack of care and cleaning for Airless spraying equipment reduces operational capacity and service life and thus leads to additional costs due to loss of work, repair or early purchase of new spraying equipment and accessories. In the following article we will look at how we can properly clean, care for and extend the life of an Airless machine. Follow these guidelines for cleaning Airless spraying equipment. 1. Cleaning airless spraying equipment A neglected paint syringe After spraying with the airless appliance, the paint must be pumped out of the nozzle and the airless hose, otherwise the spray material may harden in the nozzle, hose and spray gun which may lead to malfunctions and defects. The curing and drying of the paint in the paint spray should be avoided further as it can cause damage and therefore cause high repair costs. Cleaning of the paint spraying device of water-soluble paints and spraying materials Cleaning water-soluble paint and spraying material is done with tap water. If necessary, lukewarm water can be used. To do this, put the suction of the airless device in one bucket of water and allow the water to pull in. At low pressure, pump the remaining paint into the paint bucket, using the prime pump, until water comes in. Similarly, the paint can also be pumped out of the high-pressure hose, using the spray setting, back into the paint bucket until water comes in. In this way, no paint is wasted and the environment and your wallet is saved. An Airless syringe cleans then you clean the filters and sieve the airless device. Depending on the equipment of the nozzle, the suction sieve, the main filter and the cannon filter must be cleaned and removed from paint residue. The suction sieve is located on the intake manifold and hangs directly in the paint bucket to prevent larger sediments in the paint spray. This suction sieve can be unscrewed and easily washed off. If a main filter is present, the filter housing must be opened and the filter should also be rinsed out. The gun filter is in the handle of the paint spray gun and should also be removed and rinsed or replaced. Cleaning the airless device of solvent-based paints and spraying materials The procedure for cleaning an airless spraying unit of solvent-based materials is like the process described above for water-soluble inks, but instead of water solvents such as thinners are used. Harder substances such as acetone should be avoided because seals can deteriorate. Accessories such as spray guns should not be placed in solvent, as seals can be damaged here too. When using solvents, health and safety at the adequate ventilation and environmentally friendly disposal. 2. Cleaning the nozzles Cleaning mouths is not easy, Although modern reversing syringes can be blown from behind in case of blockages, a cleaning system in the form of hourglass is recommended for prolonged cleaning and storage. Two manufacturers offer a suitable cleaning system: TipClean from Wagner and the FARBMAX nozzle cleaner. Spray tip cleaner Wagner TipClean & FARBMAX Nozzle Cleaner Using one of these nozzle cleaning systems can prevent sticking paint to the airless nozzles and extending their lifespan. Cleaning fluid for replenishing the hourglass is available from both Wagner and FARBMAX in 1-litre bottles. Wagner 1 litre refill bottle TipClean – click here to view product in store FARBMAX 1 liter refill bottle TipCleaner – click here to view product in the store Especially stubborn blockages in nozzles can be easily solved with spray needles. For this purpose, the fine nozzles are directed into the mouthpiece to build up the residual paint. Spray tip cleaning needles Cleaning paint spray mouthpiece with needle If you want to learn all about Airless nozzles, read our Ultimate Airless Spray Tip Guide here (article). 3. Cleaning Airless spray gun In addition to the filter in the gun and the nozzle, the gun itself and the nozzle holder must also be cleaned. For this purpose, small brushes in different strengths are suitable to clear the paint channel and the filter chair from paint residue. Take car, when cleaning, the small seals between the gun and the mouthpiece are often lost. Here is an overview of the most common stamps for pistols from manufacturers Graco, Wagner, FARBMAX and many other brands. As already mentioned, spray guns should not be placed in solvent. Airless nozzle seals Choose from our selection of gaskets here – check out products in the Airless Discounter Shop 4. Care and storage of an airless paint spray if the airless spraying device is used for several days, the evaporation of liquids from the paint sprayer and corrosive processes may lead to adhesion and sticking of the valves (intake and outlet valve), which may interfere with function and suction mechanism during the next operation. This disruption can be so severe that the complicated and expensive removal and cleaning of the valves will be necessary. Therefore, preservation for the protection of the airless device is recommended for multi-day or longer breaks. Various care products from the manufacturers Wagner, Graco and FARBMAX are available. Wagner EasyClean, Graco Pump Armor and FARBMAX Airless care in 100 ml and as 1 liter bottle. These care products are diluted with water in a ratio of 30:1 and pulled into the nozzle. There the mixture remains and retains the pump until the next use. Cleaning Airless spray products Graco Pump Armor, Wagner EasyClean & FARBMAX Airless Care All in one maintenance kit – view product in the shop kit consists of: FARBMAX protective oil for piston pumps FARBMAX tip cleaner for Airless spray tips – 200 ml FARBMAX Airless cleaners – 1 Litre oil for the care of diaphragm pumps In In Oil should be used to care for paint spraying equipment. Membrane pumps from Wagner, FARBMAX and other manufacturers contain hydraulic oil. The oil level should be checked regularly. On most airless membrane pumps there is a sight glass or a measuring rod for checking the oil level. In case of oil loss, the cause should be identified, eliminated and filled with hydraulic oil. After 100 hours of use, an oil change should be applied to a new device. After that, an oil change after every 500 operating hours is recommended, unless otherwise recommended by the manufacturer. Oil for the care of piston pumps Piston pumps should get a dash of oil on the pistons for each job to protect the seals and piston. Special piston oil is available from all major manufacturers and attaches particularly well to the piston, despite the continuous up and down movement of the piston itself. FARBMAX protective oil for piston pumps and Graco TSL oil is recommended. Oil the piston on a Graco Mark X and there you have it! All the information you need to clean your Airless Sprayer. If you have any questions about the cleaning products, please fill out our contact form below or call us on +49 (0) 30 220 154 36. We are happy to assist you.
